

XXXI Simposio Peruano de Física

Monday 15 December 2025 - Friday 19 December 2025

Lima. Peru

Libro de resúmenes

**This edition, the XXXI Simposio Peruano
de Fisica, will be in a hybrid mode.**

The main purpose of this event is to stimulate cooperation between local researchers, students and international guest scientists, some of whom are Peruvians working abroad and willing to contribute to the development of physics in Peru. Due to the present global delicate situation, this year's edition of the Meeting of Physics will be held in a hybrid mode. There will be online real-time presentations of keynote speakers, as well as talks on current research in the areas of theoretical, experimental, computational, applied and educational physics will be presented by local and international scientists. In addition, several MSc and PhD students will also present their investigations in electronic poster sessions. This year, a new topic will be included in presentations involving interdisciplinary research related to the covid-19 pandemic. We will have talks in English, but also in Spanish.

Contents

New machine learning techniques for anomaly detection in the Global Trigger of the Level-1 Trigger system of the CMS experiment at CERN	1
Innovación en textiles funcionales: protección uv y propiedades antimicrobianas	1
Nanotecnología	1
Quantum Machine Learning	1
Aplicaciones del reactor nuclear RP-10 en física de neutrones	1
Observatorio nuclear: resurgimiento de la energía nuclear	2
Detección de Cáncer de Mama mediante SERS: El Potencial de los Nanocompuestos de Oro y Sílice	2

Coffee break & posters / 2**New machine learning techniques for anomaly detection in the Global Trigger of the Level-1 Trigger system of the CMS experiment at CERN****Autor(es):** Sebastian Paucar¹**Coautor(es):** Carlos Javier Solano Salinas²¹ UNI² Universidad Nacional de Ingenieria**Autor(es) correspondiente(s):** jsolano@uni.edu.pe, sebastian.paucar.m@uni.pe

At LHC, two main approaches test the validity of the Standard Model (SM): comparing precise measurements of SM processes with theoretical predictions and conducting direct searches for new particles predicted by models beyond the SM (BSM). These direct searches rely on fully supervised analyses targeting specific BSM scenarios, effective only if the correct model is tested. However, many BSM searches have yielded negative results, suggesting that unanticipated scenarios may exist. The vast data generated at the LHC, with 40 million collisions per second but only ~1000 events stored per second, exacerbates this challenge.

The Level-1 Trigger (L1T) processes collisions at 40 MHz, using specialized hardware to reduce the rate to 100 kHz. The Global Trigger is the final step of the CMS L1T system and runs a trigger menu called the L1 menu, which defines early event selection criteria, plays a critical role in capturing SM and BSM signals. However, model-dependent algorithms often exclude low-energy or unusual events, missing important signals have been implemented.

Unsupervised ML techniques have gained attention new physics detection in a model-agnostic, data-driven way. A fast, quantized anomaly detection trigger algorithm based on variational autoencoders is currently in use in the L1T is presented.
